

- Q1. Write a program to print the integer value 10.
- Q2. Print three integers 5, 10, 15 in a single line.
- Q3. Assign the string "Dhananjay Puri" to a variable named name and print it.
- Q4. Store your first name and last name in two separate variables and print them together.
- Q5. Use the .format() method to print: "My name is [name] and I live in [city]".
- Q6. Use an f-string to display the message: "My age is [age]".
- Q7. Assign values 1, 2, 3 to variables a, b, c and print them separated by a pipe symbol (|).
- Q8. Output the literal string "Python and Rocks!".
- Q9. Declare two numbers and print their sum with a descriptive label.
- Q10. Write a script that takes a user's name as input and greets them.
- Q11. Assign a city name to a variable and print it.
- Q12. Value Swapping: Swap the values of num1 and num2 using a temporary variable.
- Q13. Perform multiple assignments in one line for variables i, j, k (two integers and one string) and print them separately.
- Q14. Assign the value "Red" to three different variables in a single line and print all three.
- Q15. Create a float variable and use the type() function to print its data type.
- Q16. Combine a string variable (name) and an integer variable (age) into a single print statement.
- Q17. Multiply two integers and print the result.
- Q18. Assign a boolean value True to a variable named is_python_fun and print it.
- Q19. Assignment Operators: Increase the value of variable x by 5 using the += operator.
- Q20. Object Identity: Assign the same value to three variables, print

their `id()`, change one variable, and observe the memory address change.

Q21. Initialize five variables to 0 in one line, print their memory IDs, update one, and print the new ID.

Q22. Define a variable `x`, print it, and then use the `del` keyword to remove it from memory.

Q23. Calculate and print the sum of `x = 5` and `y = 7`.

Q24. Pythonic Swapping: Swap two variables `num1` and `num2` without using a temporary variable.

Q25. Multiply 5 by 8, store it in a variable `result`, and print it.

Q26. Assign two values to two variables in a single line and print them.

Q27. Error Handling: Create a message, print it, delete it, and try to print it again to observe the `NameError`.

Q28. Create variables for first and last names and print them side-by-side.

Q29. Update a variable `num` by adding 5 to its existing value.

Q30. Store the string "Hello" in a variable named `greeting` and print it.
